

$$\begin{aligned}
 1(a) \quad & ((\lambda x. (\underbrace{x \ x}_{\uparrow \uparrow}) \ \underbrace{\lambda y. y}_{\uparrow}) \ \lambda y. y) \\
 &= ((\underbrace{\lambda y. y}_{\uparrow} \ \underbrace{\lambda y. y}_{\uparrow}) \ \lambda y. y) \\
 &= (\underbrace{\lambda y. y}_{\uparrow} \ \underbrace{\lambda y. y}_{\uparrow}) = \lambda y. y
 \end{aligned}$$

$$\begin{aligned}
 1(b). \quad & ((\lambda x. \lambda y. (\underbrace{x \ (y \ y)}_{\uparrow \uparrow})) \ \underbrace{\lambda a. a}_{\uparrow}) \ b) \\
 &= (\lambda y. (\underbrace{\lambda a. a}_{\uparrow} \ \underbrace{(y \ y)}_{\uparrow})) \ b) \\
 &= (\underbrace{\lambda y. (y \ y)}_{\uparrow} \ \underbrace{b}_{\uparrow}) = (b \ b)
 \end{aligned}$$

→ can be done in another sequence of  $\beta$ -reduction

$$\begin{aligned}
 &= (\lambda y. (\underbrace{\lambda a. a}_{\uparrow} \ \underbrace{(y \ y)}_{\uparrow})) \ \underbrace{b}_{\uparrow}) \\
 &= (\underbrace{\lambda a. a}_{\uparrow} \ \underbrace{(b \ b)}_{\uparrow}) = (b \ b)
 \end{aligned}$$

$$\begin{aligned}
 1(c) \quad & ((\lambda x. (\underbrace{x \ x}_{\uparrow \uparrow}) \ \underbrace{\lambda y. (y \ x)}_{\uparrow}) \ z) \\
 &= ((\underbrace{\lambda y. (y \ x)}_{\uparrow} \ \underbrace{\lambda y. (y \ x)}_{\uparrow}) \ z) \\
 &= ((\lambda y. (y \ x) \ x_1) \ z) \\
 &= ((x_1 \ x) \ z)
 \end{aligned}$$

(Avoiding same names?)

$$1(d). (\lambda g. (g \lambda x. \lambda y. x) (\underbrace{(\lambda a. \lambda b. \lambda h. ((h a) b) z_1)}_{\text{let's call this } P}) z_2))$$

$$\therefore ((\lambda a. \lambda b. \lambda h. ((h a) b) z_1) z_2)$$

$$= (\lambda b. \lambda h. ((h z_1) b) z_2)$$

$$= \lambda h. ((h z_1) z_2)$$

Proceeding further

$$(\lambda g. (g \lambda x. \lambda y. x) \underbrace{\lambda h. ((h z_1) z_2)}_{\text{let's call this } Q}))$$

$$= (\underbrace{\lambda h. ((h z_1) z_2)}_{\text{let's call this } Q} \underbrace{\lambda x. \lambda y. x}_{\text{let's call this } P})$$

$$= ((\lambda x. \lambda y. x) z_1) z_2$$

$$= (\lambda y. z_1) z_2 = z_1$$

$$1(e). ((\lambda t. \lambda y. (\underbrace{(t y)}_{\text{let's call this } P}}) \underbrace{\lambda n. \lambda f. \lambda x. (f ((n f) x))}_{\text{let's call this } Q}) \lambda g. \lambda z. (g (g z)))$$

$$= (\underbrace{\lambda y. (P y)}_{\text{let's call this } Q}} \underbrace{\lambda g. \lambda z. (g (g z))}_{\text{let's call this } P}))$$

$$= (P \underbrace{\lambda g. \lambda z. (g (g z))}_{\text{let's call this } Q}))$$

$$= (P Q)$$

Therefore,  $(\lambda n. \lambda f. \lambda x. (f ((n f) x))) \underbrace{Q}_{\text{let's call this } Q})$

$$= \lambda f. \lambda x. (f ((Q f) x))$$

We proceed with computation of  $((\text{Q } f) \ x)$

i.e.,

Page 3

$$\begin{aligned} & ((\lambda g. \lambda z. (g \ (g \ z))) \ f) \ x) \\ &= (\lambda z. (f \ (f \ z))) \ x \\ &= (f \ (f \ x)) \end{aligned}$$

Therefore

$$(P \ Q) = \lambda f. \lambda x. (f \ (f \ (f \ x)))$$

2(a). Apply on true:

$$\begin{aligned} & (\lambda x. ((x \ \text{false}) \ \text{true}) \ \text{true}) \\ &= ((\text{true} \ \text{false}) \ \text{true}) \\ &= ((\lambda x. \lambda y. x \ \text{false}) \ \text{true}) = \text{false} \end{aligned}$$

Apply on false  
you will get true.

Function ~~and~~:  $\neg$ . boolean operation

2(b) Apply on zero

$$\begin{aligned} & (\lambda n. ((n \ \lambda p. ((p \ \text{false}) \ \text{true}))) \ \text{false}) \ \text{zero}) \\ &= ((\text{zero} \ \lambda p. ((p \ \text{false}) \ \text{true}))) \ \text{false} \end{aligned}$$

zero is  $\lambda f. \lambda x. x$

$$\begin{aligned} \text{Therefore, } & ((\lambda f. \lambda x. x \ \underbrace{\lambda p. ((p \ \text{false}) \ \text{true}))}_f) \underbrace{\text{false}}_x) \\ &= \text{false} \end{aligned}$$

Apply on one, it would be

$$((\lambda f. \lambda x. (f \ x) \ \underbrace{(\lambda p. ((p \ \text{false}) \ \text{true}))}_{\text{false}})) \ \text{false})$$

page 4

$$\equiv (\lambda p. ((p \ \text{false}) \ \text{true})) \ \text{false}$$

$$\equiv ((\text{false} \ \text{false}) \ \text{true})$$

$$\equiv ((\lambda x. \lambda y. y \ \text{false}) \ \text{true}) = \text{true}.$$

Apply on two. That would ~~im~~ lead to applying  $(\lambda p ((p \ \text{false}) \ \text{true}))$  twice on false. We know from above, applying it one-time leads to true.

$$\text{Applying } (\lambda p ((p \ \text{false}) \ \text{true}) \ \text{true})$$

$$= ((\text{true} \ \text{false}) \ \text{true})$$

$$= ((\lambda y. \lambda x. y \ \text{false}) \ \text{true})$$

$$= \text{false}$$

In other words, the result toggles from true to false as we increase the # of application of  $\lambda p ((p \ \text{false}) \ \text{true})$

zero-application  $\rightarrow$  False

one application  $\rightarrow$  True

two application  $\rightarrow$  False

Function : isODD

condition for naturals

2(c)  $(m \text{ (mul } n))$  where  $m$  is a natural number  
implies  $m$ -applications of  $(\text{mul } n)$ .

$\therefore (\underbrace{(m \text{ (mul } n))}_{m \text{ applications of } (\text{mul } n)} \underbrace{(\text{succ zero})}_{\text{one}})$  implies

$m$  applications of  $(\text{mul } n)$  to one.

Pg 5

In other words,

$$((\underbrace{\text{mul } n (\text{mul } n) \dots (\text{mul } n)}_{m \text{ - times}} \underbrace{\text{one}}_m)) \dots)$$

$$= (n \times \underbrace{(n \times \dots \times (n \times 1))}_{m \text{ - times}}) \dots)$$

$$= n^m$$

2(d) Apply on some signed number  $((\text{Pair } z_1) z_2)$   
 $((\text{Pair } (\text{sec } ((\text{Pair } z_1) z_2))) (\text{fst } ((\text{Pair } z_1) z_2))))$   
 $= ((\text{Pair } z_2) z_1)$

The ~~input~~ input pair represents  $z_1 - z_2$   
 output pair  $n$   $z_2 - z_1$

page 6

Function: negates a signed number

2(e) Outline: input  $z_1 - z_2$  and  $y_1 - y_2$   
 output  $(z_1 + y_2) - (z_2 + y_1)$

Function: subtraction of signed numbers.
